AI Systems / Backend (Node.js, TypeScript, PostgreSQL)

Focus: applied AI engineering and developer tooling (agent loops, integrations, retrieval plumbing, secure execution) — not model training.

Education Siksha 'O' Anusandhana (SOA) University, Bhubaneswar, Odisha

2023 – 2027

B.Tech in Computer Science and Engineering

Experience Freelance Full-Stack Engineer (Remote)

- Built backend services in Node.js/Express with PostgreSQL; shipped auth (RBAC), payments + webhooks, and production deployments on AWS (S3/RDS/Fargate).
- Delivered end-to-end features quickly with clean API boundaries and predictable data flow.

Projects (Security / Agentic Work) SandboxAI — TypeScript, Node.js, Docker, OpenRouter API, PostgreSQL, React

- Built an LLM agent loop from scratch with tool-calling and a self-correcting execution loop (stderr-driven retries).
- Engineered an isolated Docker sandbox (resource limits + network isolation + hard timeouts) for safe execution of untrusted, model-generated code.
- Implemented intent routing and tested behavior on large datasets (50k rows), returning structured outputs to a web UI.

Multi-Tenant RBAC Platform — PostgreSQL, Express, Next.js, Clerk

- Designed tenant isolation and permission models, useful for building least-privilege AI workflows and secure integrations.

Skills Backend: Node.js, TypeScript, PostgreSQL, Redis (familiar), REST APIs, async jobs, webhooks

AI / Infra: LLM API integration (OpenRouter), tool-calling agents, vector DB concepts, Docker sandboxing

Cloud: AWS (S3, RDS, Fargate), CI/CD
